<p align="center">Anime Rating Analysis - Project Summary</p>

Tools Used

This project was completed using Python in a Jupyter Notebook environment. The primary Python packages used were pandas for data cleaning and manipulation and matplotlib for data visualization. The dataset was stored and accessed as CSV files.

Questions Asked

The main question guiding this project was whether structural factors in anime, specifically episode count, release season, genre, and studio, have a meaningful relationship with overall anime ratings. The analysis aimed to test common assumptions within the anime community using data rather than opinion.

Insights Discovered

The analysis revealed no clear relationship between any of the targeted characteristics of an anime and its rating. The analysis was not fruitful in its efforts to find a trend.

Recommendations

If presenting to a client, the key recommendation would be to acquire the rights to whichever show they have the desire to produce.

Future

In the future, I would like to pull in more data. I would want to compare the *popularity* instead of the ranking to find answers, and even compare an anime's current success to see if it is reflective of its manga counterpart.
